For Grown-Ups: How to Use These Worksheets

One page at a sitting. For third grade.

Why use it

A unit fraction is a fraction with 1 on top, and the bottom number says how many equal parts make the whole (Common Core 3.NF.A.1, TEKS 3.3(C)). Third grade starts here because every other fraction is built from one: 3/4 is three pieces of size 1/4. If you learned fractions as two numbers to read off a picture, naming the one piece first may look different, and it is why the top number stays 1 on this whole sheet.

What it is good for

- Saying what one equal part of a whole is called.
- Counting all the equal parts before writing the fraction.
- Seeing the same fraction on a bar, a circle, and a rectangle.

How to use it

1. Point to a picture and count every equal part together.
2. Your child writes 1 on top, for the one part that is shaded.
3. Your child writes the number of equal parts on the bottom.
4. Say the fraction aloud: one sixth, one eighth.
5. Check with the answer key, where the answers are in red.

> **Try saying:** “How many equal parts in all? What is one of them called?”

Tip: If your child counts only the parts that are not shaded, have them touch every part, the shaded one too, and then write the bottom number.
